there is a tendency of an increasing number of signals and derived variables to be incorporated in the monitoring of patients during anesthesia and in intensive care units the addition of new signals hardly ever leads to the deletion of other signals this is probably based on a feeling of insecurity we must realize that each new signal that is being monitored brings along its cost in terms of risk to the patient investment and time it is therefore essential to assess the relative contribution of this new signal to the quality of the monitoring process i e given the set of signals already in use what is the improvement when a new signal is added beyond a certain point the addition of new information leads to new uncertainty and degrades the result ream 1981 in the diagnostic process it is possible to evaluate result in an objective qualitative way the changes in the sensitivity and specificity of the diagnosis as a result of the addition or deletion of a certain variable can be calculated on the basis of false negative false positive correct

negative and false negative scores different methods for multiple regression analysis have been implemented on computers gelsema 1981 which can support such decision processes in monitoring the situation is much more complex many definitions of monitoring have been given the common denominator is that monitoring is a continuous diagnostic process based upon a semi continuous flow of information this makes simple assessment methods useless
